against an antigen such as cells, cell extracts, proteins, carbohydrate, viral extracts, viruses, lipids, glycolipids, carbohydrate, viral extracts, viruses, bacteria, fungi, parasites and carbohydrate, viral extracts, viruses, bacteria, fungi, parasites and allergens. It can also be used for treating an infectious disease, allergic diseases and asthma, as well as thrombocytopaenia which is drug-induced, due to an autoimmune disorder such as idiopathic thrombocytopaenic purpura, or resulting from accidental or therapeutic radiation exposure. It can also be used for treating anaemia such as thrombocytopaenia which is adjaction exposure. It can also be used for treating anaemia such as haemoglobinopathy and inherited haemolytic disorder, genetic disorders such as haemoglobinopathy and inherited haemolytic anaemia, inadequate production despite adequate iron stores, chronic disease such as kidney failure, and chronic inflammatory disorder such as rheumatoid arthritis, or anaemia cresulting from accidental or therapeutic radiation exposure. AAZ48029 represent phosphorothicate CpG oligonucleotides used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method using CpG containing oligonucleotides (ONs) for regulating immune system remodeling and for regulating haematopoleasis. The method for inducing an antigen-specific immune response comprises: (1) administering an ON having a sequence including at least the formula (1); and (2) exposing the subject to an antigen sequence for an antigen-specific immune response: 5' XICGX2 3' (1), where the ON = includes at least 8 nucleotides; C and G = unmethylated, and X1 and X2 = nucleotides. The method can be used for inducing an immune response
                                                                                                                                                                                                                                                                                                    CpG containing oligonucleotides for, e.g. inducing an antigen-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Seguence 20 BP; 3 A; 6 C; 4 G; 7 T; 0 U; 0 Other;

The method is for treating a subject having, or at risk of having an acute decrement in air flow, comprising administering a nucleic acid sequence containing at least one unmethylated CpG. The nucleic acids containing an unmethylated CpG dinucleotide affect an immune response in a subject by activating natural killer cells (NK) or redirecting anocytic and other cells to produce Thi cytokines. They can be used to treat pulmonary disorders having an immunologic component, such as asthma or environmentally induced airway disease. They can also be used to treat diseases associated with Grampositive bacterial infections or endotoxaemia including bacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAV28155-268 represent oligonucleotides which can be purified using the method of the invention. The specification describes a matrix that comprises a support and naffility unit that specifically and reversibly binds a target oligonucleotide, and comprises a sequence of bases having the reverse complement of a hybridising portion of the target oligonucleotide. The matrix is used for affinity purification of synthetic oligonucleotide, specifically antisense agents, for treatment of hyperproliferative diseases, for treating a non-pathogen, non-fryperproliferative diseases, e.g. Alzheimer's, for modulating expression of cell surface proteins, and to inhibit a eukaryotic pathogen,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matrix for selective separation of oligo:nucleotide - useful for, large scale purification of anti-sense agents from their deletion derivatives formed during synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 18; DB 2; Length 18; 100.0%; Pred. CpG oligonucleotide; phosphorothioate; interleukin-12; IL-12; secretion; human PBMC; immune response; cancer; HIV; bacterial disease; asthma; neoplastic disorder; jaagsiekte; B cell; NK cell; ss; cytokine; antigen presenting cell; infection; allergic disease.
                                                                                                                                                                                                                                                                                                                                                                                                Anti-sense oligo:nucleotide(s) complementary to BCL-2 mRNA - useful for treating cancers, e.g. lymphoma(s) and some leukaemia(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This antisense oligonucleotide is complementary to the translation initiation site of the human bcl-2 mRNA. The Bcl-2 antisense oligonucleotides are phosphorothioate derivatives and can straadle strategic sites such as the translation initiation site, donor and acceptor splicing sites, or sites for transportation or degradation. Blocking translation at such strategic sites prevents the formation of functional bcl-2 gene product. These oligonucleotides may be used for treating cancers associated with high levels of bcl-2 gene expression, especially lymphomas and some leukaemias. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAV27641-751 represent immunostimulatory oligodeoxyribonuclectides (ODNs) of the invention. The ODNs contain at least one unmethylated CpG dinuclectide, and have the formula: 5' NIXICGX2N2 3', where at least one nuclectide separates consecutive CpGs, X1 is adenine, guanine, or thymine, X2 is cytosine or thymine, N is any nuclectide and N1+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer or more than one CCG or CGG trimer OR 5' NIXIZCGX3X4N 3', where at least one nuclectide separates consecutive CpGs, X1 and X2 are selected from GpT, GpG, GpA, ApT and ApA, X3and X4 are selected from TpT or CpT, N1 is any nuclectide and N1+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer or more than one CCG or CGG trimer. The ODNs activate lymphocytes in a subject and redirect a subject s immune response from a Th2 to a Th1 (e.g. by inducing monocytic cells and other cells to produce Th1 cytokines, including IL-12, IFN-gamma and GM-CSF). The ODNs can be used to treat or prevent an asthmatic discases, autoinmune diseases, in desensitiasation therapy, as an artificial adjuvant during antibody generation in a mammal such as a mouse or a

Sequences AAZ41856-Z41949 are phosphorothicate CpG oligonucleotides which are used in the invention comprises stimulating an immune response in a subject comprising administering to a subject exposed to an antigen, an immunopotentiating octokine and an immunostimulatory CpG oligonucleotide immunopotentiating cytokine and an immunostimulatory CpG oligonucleotide continues a sponse against anacra antigen. The methods are useful for treating cancer by stimulating an antigen specific immune casponse. The methods are useful for treating cancer by stimulating an antigen specific immune casponse against an humans, including but not limited to: sarcoma, carcinoma, fibroma, inhumans, including but not limited to: sarcoma, carcinoma, fibroma, Lymphoma, melanoma, neuroblastoma, retinoblastoma, and glioma. The methods act also useful for treating infectious diseases.

Carcinoma, fibroma and bord as also useful for treating infectious diseases.

CT he methods may also be useful for treat cancer and tumours of mon human subjects, e.g. cats and dogs. Neoplasias affecting agricultural livestock may also be treated and include leukaemia, hammanglopericytoma and bovine ocular neoplasia. Chronic, infectious, conteaglous diseases of sheep and goats caused by the bacterium contead by laagaiekte may also be treated. CpG oligonucleotides can be conteaglous than activating B cells, NK cells, and antigen bresenting cells, such as monocytes and macrophages. CpG oligonucleotides enhance antibody dependent cellular cytotoxaticity and can be used as an adjuvant in cyclouncleotidy and conjunction with tumour antigens to protect against a tumour challenge
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CpG oligonucleotide; phosphorothioate; interleukin-12; IL-12; secretion; human PBMC; immuna response; cancer; HIV; bacterial disease; asthma; neoplastic disorder; jaagslekte; B cell; NK cell; ss; cytokine; antigen presenting cell; infection; allergic disease.
                                                                Novel synargistic combinations of immunostimulatory oligonucleotides and immunopotentiating cytokines are useful for stimulating the immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

contractions and properties at the second from the sequences are used in the invention to induce interleukin-12 (IL-12) secretion from human PBMC. The invention comprises stimulating an immune response in a subject comprising administering to a subject exposed to an antigen, an immunopotentiating cytokine and an immunostimulatory CpG oligonucleotide to induce a synergistic antigen specific immune response. The methods are altimulating an antigen specific immune response against a cancer antigen. The methods can also be used to treat neoplastic disorders in humans, including but not limited to: sarcoma, carcinoma, fibroma, Lymphoma, melanoma, neuroblastoma, retinoblastoma, and glioma. The methods are also useful for treating infectious diseases, e.g. viral diseases such as HIV, bacterial diseases, and fungal diseases, e.g. viral diseases such as HIV, bacterial diseases, e.g. asthma. The methods and compositions may also be used to treat cancer and tumours control in the stock may also be treated and include leukaemia, in non human subjects, e.g. cats and dogs. Neoplasias affecting agricultural livestock may also be treated and include leukaemia, contagious diseases of sheep and goats caused by the bacterium corruptions of sheep and goats caused by the bacterium pseudotuberculosis, and contagious lung tumour of sheep causeful in activating B cells, NK cells, and antigen presenting caused by langualed and antigen presenting caused by the monocytes and macrophages. CpG oligonucleotides enhance antibody contagious tellulum cytocoxicity and can be used as a manocytes and macrophages. CpG oligonucleotides enhance antibody contagious in the lunar cytocoxicity and can be used as an adjuvant in
                                                                                                                                                                                              Sequences AAZ41856-Z41949 are phosphorothioate CpG oligonucleotides which
                                                         Novel synergistic combinations of immunostimulatory oligonucleotides and immunopotentiating cytokines are useful for stimulating the immune

phosphorothicate or phosphodiester bonds. The oligonucleotide is lipidencappulated using the method of the invention. A composition comprising lipide-encapsulated particles of a therapeutic agent, e.g. antisense oligonucleotides, is prepared by mixing at least 2 lipids with buffered aqueous solution of charged therapeutic agent to form an intermediate mixture to lipid-encapsulated particles, and changing the pH of the mixture to neutralise at least some of the external surface charges on the particles. One lipid has a (de) protonatable group with Ka such that the lipid is charged at a first pH but neutral at a second pH (particularly near physiological pH) and the buffer maintains this lipid in the charged form (1.e. cationic when the therapeutic agent is anionic in the buffer, or vice versa). The second lipid prevents particles aggregation during formation of the lipid-therapeutic agent particles. The composition is used to introduce therapeutic agents into cells, in vivo, particularly to treat or prevent diseases associated with aberrant gene expression in mammals, specifically tumours,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a CpG adjuvant that can be used in the vaccine composition of the invention. The vaccine comprises a polyoxyethylene elekter or ester (I), not in the form of a vesicle, pharmaceutically acceptable excipient and an antigen (Ag) or antigenic composition. The vaccine can be used to treat or prevent infections (by bacteria, viruses or other parasites), allergy and cancer. (I), which are safe, easy to sterilize and simple to administer, are powerful vaccine adjuvants, able to induce a systemic immune response when administered (non-invasively) to the mucosa. The response is at least as good as that from conventional systemic injection. (I) are effective at low concentration, have low
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CpG adjuvant, vaccine, polyoxyethylene ether, polyoxyethylene ester, antigen, infection, allergy, cancer; therapy; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAX25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used for preventing or treating HPV induced tunnurs. This sequence represents a CpG oligonucleotide which is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition containing lipid-encapsulated therapeutic agent - useful, e.g. for delivering antisense molecules or ribozymes or treating diseases associated with aberrant gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense oligonucleotide; human bcl-2 gene; phosphorothioate; phosphodiester; lipid-encapsulation; tumour; aberrant gene expression; treatment; inflammation; infection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents an antisense oligonucleotide directed against the human bcl-2 gene. The oligonucleotide can have either
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                             Composition comprising an E6, E7 or E6/E7 fusion protein from HPV to induce immune response to HPV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cullis P;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 . 18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the their phosphonates (I), and silyloxymethyl halides (II). (I) are intermediates for synthesis of RNA-oligonucleotides with predetermined nucleotide sequence, particularly by machine synthesis. The groups opecified above, apart from those on silyl, are those particularly for the cyanocthyl phosphoramidate coupling. Uses of the oligoribonucleotide products in diagnosis, therapy, and as research tools, are well known, and are not dealt with in detail. (II) is an intermediate for (I). The silyloxymethyl halide reagent is easy to prepare, and yields are high. Introduction of the silyloxymethyl group into the ribonucleoside is simple and rapid, and the acetal bond formed does not migrate, eliminating particularly the prior art problem of 2 to 3 isomerisation. The methylenedloxy group spacer between the silyl group and nucleoside ring results in less steric hindrance than bulky direct silyloxy in results in less steric hindrance than bulky direct silyloxy coupling. Purer products are therefore obtained than in prior art, enabling larger quantities and longer chains of oligoribonucleotides to each anabling larger quantities and in shorter times
                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2-Silyloxymethyl ribonucleosides and their phosphonate derivatives - have high purity, use in machine synthesis of ribonucleic acids, enable longer oligonucleotide chain construction, and larger amounts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to silyloxymethyl protected D- or L-ribonucleosides

A pharmaceutical composition has been developed which comprises a nucleic acid and at least one penetration enhancer. The compositions are used: (i) to treat or prevent any disease or disorder that can be treated with the nucleic acid, e.g. cancer, Alzheimer's disease, beta-thalassemia, malaria, viral infections (including human immune deficiency virus (HIV)), inflammation, in human or animal medicine; (ii) to investigate the role of a gene or gene product in non-human animals; and (iii) to modulate gene expression in cells, tissues or organs. The compositions provide bloavallability of at least 15, preferably 17-35, %. The provide bloavallability of at least 15, preferably 17-35, %. The chances of the alimentary canal and into cells, and (ii) increases tability of the nucleic acid. Oral administration avoids the complications and expense of intravenous or other methods of administration. AAX18669 to AAX18799 and AAX18801 represent antisense clustention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present invention describes a composition comprising two oligonucleotide analogues, each having a binding domain and a coupling moieties of hybridizing to a target moietie and the coupling moieties are capable of coupling to each other in the absence of a target molecule. The composition/compound is used to cleave an RNA target. The compositions can be used to determine an optimal antisense site for a given mRNA or an optimal ribozyme cleaves it for a target RNA. By separating the antisense molecules into two or more pieces, a comprehensive antisense library can be prepared in advance, rather than synthesizing a plurarity of candidate antisense molecules as needed. A complete library of every possible 17-mer oligonucleotide, using the four natural bases, would consist of 417 or least two components, e.g. a library of 8-mers and a library of 9-mers, assembled quickly as needed, the library size is reduced to 48 + 20 or 327 650 molecules. The complexity of the library can be further sequence by substituting one or more universal or degenerate bases for some of the natural bases. The present sequence represent invention
                                                                                                                                                                                                                                                                         Oligonucleotide analog compositions capable of coupling to form antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Deletion sequence oligonucleotide; sensor array; eukaryotic pathogen; probe; cellular adhesion modulator; cellular proliferation modulator; human retrovirus; human immunodeficiency virus; non-human retrovirus; HIV; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a formulation (A) comprising a cytosine-guanosine dinucleotide motif (CpG) oligomucleotide and T-independent type 1 or type 2 antigens or polysaccharide conjugate antigen. The present sequence represent a specifically claimed CpG oligomucleotide. A vaccine composition comprising the formulation is used for inducing a immune response to T-independent type 1 or type 2 antigen or polysaccharide conjugate antigen. The use of immunostimulatory CpG oligonucleotide acts as an adjuvant to pneumococcal polysaccharides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A vaccine composition for inducing a immune response to T-independent type 1 or type 2 antigen or polysaccharide conjugate antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conbinatorial antisense library, oligonucleotide analogue, RNase, ribozyme, cleavage, anchor, binding, target RNA, 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

This invention describes a novel composition comprising a number of sensor arrays, where each array comprises a unique probe oligonucleotide, which is the reverse complement of part of a unique target oligonucleotides which is the reverse complement of target deletion sequence oligonucleotides. The compositions form a method for characterizing a sample of target deletion oligonucleotides which are labelled and thyridiate with the probe oligonucleotides of the sensor arrays. Such compositions that are useful for modulating cellular adhesion or proliferation, and being active against a eukaryotic pathogen, a human cretrovirus, a human immunodeficiency virus (HIV), or a non-human retrovirus, including influenza virus, Epstein-Barr virus, Respiratory Syncytial virus or cytomegalovirus (CMV). The compositions enable characterization of deletion sequence oligonucleotides having related, but different nucleobase sequences, and quantification of different compositions for the oligonucleotides in a mixture. Also, if the specificity of the oligonucleotides in an inture. It is not modified, the method may be performed using collapseexpressing oligonecal compositions.
                                                                                                                                      New compositions comprising sensor arrays made up of unique probe oligonuclectides - useful for characterizing a sample of target deletion oligonuclectides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GENERAL INFORMATION:

APPLICANT: Krieg, Arthur M.

APPLICANT: Schwartz, David A.

APPLICANT: Schwartz, David A.

TITLE OF INVENTION: USE OF NUCLEIC ACIDS CONTAINING

TITLE OF INVENTION: UNMETHYLATED CpG DINUCLEOTIDE IN THE TREATMENT OF

TITLE OF INVENTION: LPS-ASSOCIATED DISORDERS

FILE REFERENCE: C1039/7011

CURRENT APPLICATION NUMBER: US/09/030,701B

PRIOR PLILING DATE: 1998-02-25

PRIOR FILING DATE: 1997-02-28

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 10. Application US/08738652B

Patent No. 6207646

GENERAL INFORMATION:

APPLICANT: Krieg, Arthur M.

TITLE OF INVENTION:

FILE REFERENCE: C1039/7004 HCL

CURRENT FILING DATE: 1996-10-30

EARLIER PPLICATION NUMBER: US 08/276,358

SARLIER FILING DATE: 1994-07-15

EARLIER FILING DATE: 1994-07-15

EARLIER FILING DATE: 1995-00-07

NUMBER OF SEQ ID NOS: 55

SOFTWARE: PSECSEQ for Windows Version 3.0

LENGTH: 20
                                                                                                                                                                                                                                      FEATURE:
OTHER INFORMATION: An oligonucleotide derived from the DNA enco OTHER INFORMATION: 60 kDa cysteine rich outer membrane protein OTHER INFORMATION: Chlamydia trachomatis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match 100.0%; Score 20; DB 3; Length 20; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 62, Application US/09030701B

Patent No. 6214806
GRNERAL INFORMATION:
APPLICANT: Krieg, Arthur M.
APPLICANT: Krieg, Arthur M.
APPLICANT: Krieg, Arthur M.
APPLICANT: Krieg, David A.
TITLE OF INVENTION: UNE OF NUCLEIC ACIDS CONTAINING
TITLE OF INVENTION: UNBEHYLATED DISORDERS
FILE REPERENCE: C1039/7011
CURRENT APPLICATION NUMBER: US/09/030,701B
CURRENT PILING DATE: 1998-02-25
PRIOR FILING DATE: 1997-02-28
                                                                                                                                                                                                                                                  OTHER INFORMATION: An oligonucleotide derived from the DNA encoding a OTHER INFORMATION: 60 kDa cysteine rich outer membrane protein from OTHER INFORMATION: Chlamydia trachomatis.
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                       ò

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 218,

Sequence 59, Application US/09286098
Patent No. 6218371
GENERAL INFORMATION:
GENERAL INFORMATION:
THE REPLICANT: Weiner, George
TITLE OF INVENTION: Methods and Products for Stimulating the
TITLE OF INVENTION: Immune System Using Immunotherapeutic Oligonucleotides and
TITLE OF INVENTION: Cytokines
FILE REFERENCE: C1039/7026/HCL
CURRENT PRELIGATION NUMBER: US/09/286,098
CURRENT PRILING DATE: 1999-04-02
EARLIER APPLICATION NUMBER: US 60/080,729
EARLIER FILING DATE: 1998-04-03
                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GENERAL INFORMATION:
APPLICANT: Krieg, Arthur M.
APPLICANT: Schwartz, David A.
TITLE OF INVENTION: USB OF NUCLEIC ACIDS CONTAINING
TITLE OF INVENTION: USB OF NUCLEIC ACIDS CONTAINING
TITLE OF INVENTION: USB OF NUCLEIC DISORDERS
FILE REPERENCE: Cl039/7011
CURRENT APPLICATION NUMBER: Us/09/030,701B
CURRENT FILING DATE: 1998-02-25
PRIOR FILING DATE: 1997-02-28
NUMBER OF SEQ ID NOS: 65
SOFTWARE: FASTSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

                                                                                                                                                                                                                                                                                                                  Sequence 104, Application US/09286098

Sequence 104, Application US/09286098

Patent No. 6218371

GENERAL INFORMATION:

APPLICANT: Karied, Arthur M.

TITLE OF INVENTION: Methods and Products for Stimulating the

TITLE OF INVENTION: Immune System Using Immunotherapeutic Oligonucleotides and

TITLE OF INVENTION: Cytokines

TITLE OF INVENTION: Cytokines

FILE REPERRING: 1039/7026/HCL.

CURRENT APPLICATION NUMBER: US/09/286,098

CURRENT FILING DATE: 1998-04-02

EARLIER FILING DATE: 1998-04-02

NUMBER OF SEQ ID NOS: 105

SOFTWARE: PSELSEQ for Windows Version 3.0

SEQ ID NO 104

LENTH: 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
